[IIDD-2] – [INDUSTRIAL INTERFACE DESIGN AND DEVELOPMENT II]

Individual Web Portfolio for Industry & OJT Placement

Project Documentation

Student Full Name: Jerald G. Faustino

Student ID: 2023101167

Program & Section: BIT – 4CG1 (CT)

Instructor: Vinna Nina O. Ramos

Active Deployment URL: https://jeraldfaustino.github.io/ojt-project

Date of Submission: November 6, 2026

Section 1: Developer Profile & Links

- **Target Industry Track / Role:** Junior Front-End Web Developer Intern
- **Live Deployment URL:** https://jeraldfaustino.github.io/ojt-project/
- **Public GitHub Repository Link:** https://github.com/jeraldfaustino/ojt-project

Professional Elevator Pitch

I am a fourth-year Computer Technology student at Bulacan State University – College of Industrial Technology who builds clean, responsive web interfaces and uses AI-assisted development to prototype quickly. I recently served as the front-end developer of a student violation and record monitoring system built with PHP and Java and prototyped in Figma. I am looking for an OJT team where I can contribute polished, mobile-friendly front-end work from day one.

Cover Letter

Dear Hiring Manager,

I am writing to apply for an On-the-Job Training placement as a Junior Front-End Web Developer Intern at your company. I am a fourth-year Bachelor of Industrial Technology student, majoring in Computer Technology, at Bulacan State University – College of Industrial Technology, and I expect to graduate in 2027.

During my studies I served as the front-end web developer of the Student Violation and Record Monitoring System, a web application that lets administrators and faculty record student violations and apply sanctions based on severity and repeat offenses. I designed the interface in Figma and implemented the Admin and Faculty dashboards. I have also built this responsive portfolio using HTML5, CSS3 and JavaScript, guided by AI tools, and deployed it online. These experiences taught me to turn requirements into working screens, to debug layouts on different devices, and to document my work clearly.

I would welcome the chance to bring this work ethic to your team. My portfolio and resume are available at the links above, and I am available for deployment in Malolos, Bulacan, Metro Manila or remotely, starting the 2nd Semester of A.Y. 2026–2027. Thank you for your time and consideration.

Respectfully,
Jerald G. Faustino

Section 2: Technology Stack & AI Tooling

1. Coding Environment & Core Stack

I wrote and edited the project in Visual Studio Code, with a live-preview workflow in Google Chrome. I used Chrome DevTools, mainly the device toolbar and the Elements and Network panels, to inspect layouts, test screen sizes and find files that failed to load. The core languages are semantic HTML5, CSS3 (custom properties, Flexbox and Grid) and a small amount of vanilla JavaScript for the mobile menu, skill filters, scroll highlighting and the copy-email button.

2. AI Vibe Coding Tools Used

I used Claude as my main AI assistant to scaffold the HTML, CSS and JavaScript, and to generate the resume and this documentation draft. I chose it because it handled long, multi-part instructions well, such as the full assignment guidelines I supplied as screenshots, and it kept code organized across separate files. I reviewed and tested every output manually before accepting it.

3. Deployment Platform

I deployed the site on GitHub Pages. It is free, serves static HTML directly from a repository, and fits the version-control basics I am learning. It also keeps my source code and live site in one place, so recruiters can view the working site and the code from the same account.

Section 3: Prompt Engineering Strategies & Iteration Log

1. Prompting Strategies Applied

Strategy A: Context-setting

Before asking for code, I gave the AI the complete assignment guidelines as screenshots, including the required folder structure, section list and content requirements. I also stated the design constraints upfront: an interactive, clean, organized site that is responsive on all screen sizes, in a black and blue color scheme. Supplying this context meant the first output already contained every required section (hero, about, skills, projects, contact and footer).

Strategy B: Iterative, component-by-component prompting

Instead of asking for everything in one prompt, I improved the site in rounds. First. I asked for the full site, then I supplied my real name, photo, project screenshots and project details, and finally I asked for a resume based on the finished portfolio. Each round changed one area, which made problems easy to spot and fix.

2. Prompt Iteration Log (Before and After)

Instance A (Layout / Component Issue)

- **Initial Prompt Given:** I supplied my project name, the two dashboard screenshots and a description of one system, the Student Violation and Record Monitoring system.
- **Flaw in AI Output***:* The guidelines require at least two project cards, but the single system filled only one component, and the earlier sample cards still held placeholder projects.
- **Corrective Follow-Up Prompt / Strategy Used:** The two screenshots showed two different views, so the project section was rebuilt as two cards, one for the Admin Dashboard and one for the Faculty Dashboard, each with my role, the PHP, Java and Figma badges, and source and demo links.

Instance B (Styling / Behavioral Issue)

- *Initial Prompt Given:* "Make an interactive HTML website according to these guidelines… the color of the website is black and blue."
- **Flaw in AI Output:** The first version used sample identity data (a placeholder name, contact details and stand-in images), so it behaved like a template instead of my personal portfolio.
- **Corrective Follow-Up Prompt / Strategy Used***:* I gave exact personal details: my name, profile photo, project screenshots, role and tech stack. I asked for them to be inserted in the existing files, so the AI edited the same structure rather than rewriting the design.

Section 4: Real Bottlenecks & Practical Problem-Solving

Bottleneck 1: Layout & Mobile View Quirks

The two-column hero section and the two-column project and skill grids were too cramped on phone widths, and the long navigation bar did not fit. I diagnosed this with the Chrome DevTools device toolbar by resizing to common phone widths. I fixed it with media queries that stack the grids into one column, a hamburger menu for small screens, full-width buttons, and wrapped contact details so long emails do not overflow.

Bottleneck 2: Live Deployment / Asset Loading Issues

Images and stylesheets can work on a local computer but fail once published, because GitHub Pages is case-sensitive and requires exact paths. Typical causes are a file named Profile.jpg while the HTML calls profile.jpg, or the project folder nested inside the repository so index.html is not at the root. I opened the DevTools Network panel to find the failing 404 requests, then renamed files to match the code exactly and made sure index.html and the assets folder sat at the repository root.

Bottleneck 3: Working with AI-Generated Code

The hardest part was that AI output is generic. I had to replace placeholder names, links and images, check that every link worked, and keep the visual style consistent across sections. Large screenshots also needed resizing and correct cropping so they stayed sharp without slowing the page. I solved this by reviewing the code section by section instead of trusting it as a whole, and by testing at several screen sizes after every change.

Section 5: Experience Reflection & OJT Readiness

1. Human vs. AI Roles

The AI did best at rapidly scaffolding semantic HTML, a consistent CSS design system, responsive rules and small JavaScript features, which saved a great deal of time. It could not supply my real information, judge whether the content was accurate, or know the details of my project. I had to provide my identity, photo, screenshots and project description, test the site on different screens, fix deployment paths, and decide what represented my work honestly.

2. OJT Industry Readiness

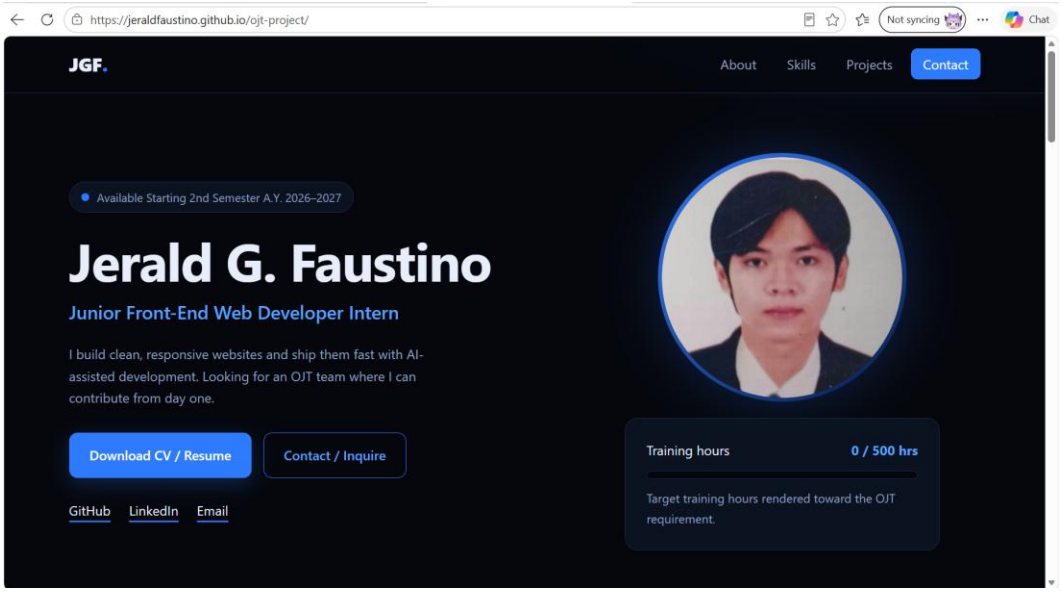

The Featured Projects section best shows I am ready for industry training. It presents a real system with a defined problem, my specific role as front-end developer, the technologies used (PHP, Java and Figma), and working source and demo links. A recruiter can see that I have worked on a practical application with real users, not only on a classroom exercise.

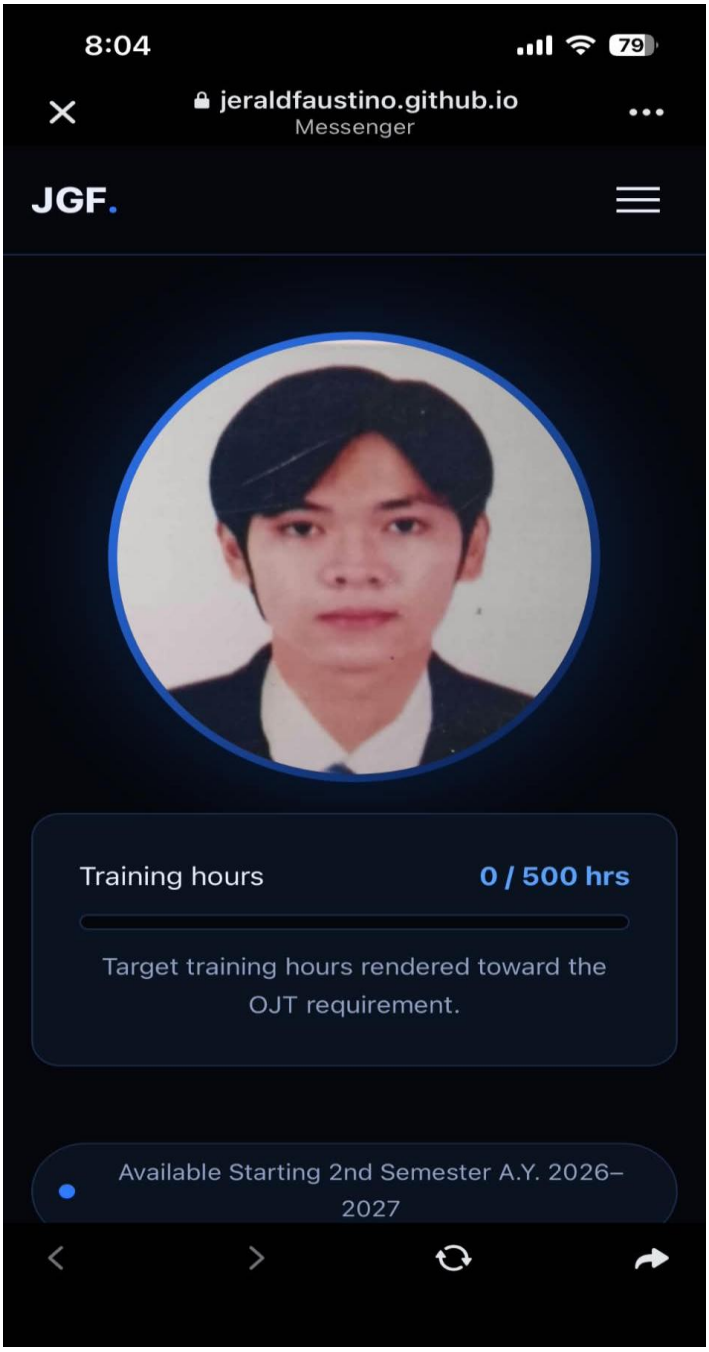

3. Future Upgrades

Before sending the portfolio to companies, I plan to add a short project case study page for the Student Violation and Record Monitoring System. It would walk through the Figma wireframes, design decisions and the final screens. This would give recruiters more evidence of my design process and problem-solving.
